

VARCHART JGantt

JavaBeans and JSF Edition

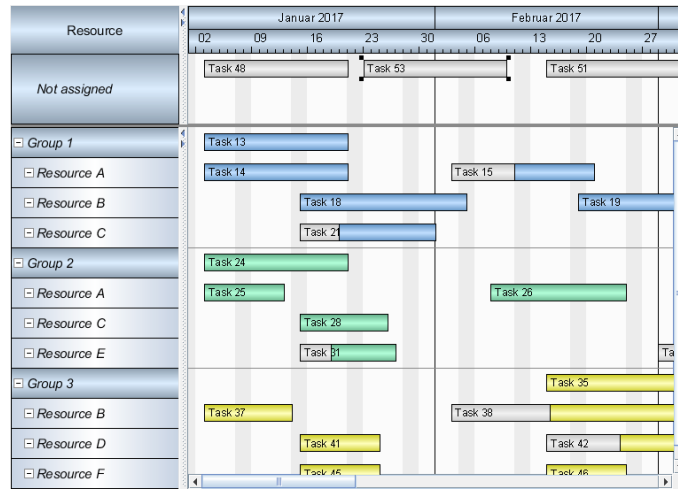

New in VARCHART JGantt 2.5

- ▶ Synchronized Gantt Charts
- ▶ Additional Information at Links
- ▶ Data Type **Color** in **NeEntity**
- ▶ Links can be Selected More Easily
- ▶ Filter Specific Selection of Nodes
- ▶ Splitter Lines Between Groups

New Functions

Synchronized Gantt Charts

In an easy way two synchronous instances of a Gantt chart can be defined where tasks can be assigned to resources.

The **JGanttSynchronizerPanel** lets you combine two Gantt instances in a way so that all modifications affecting the time axis automatically and equally apply to both diagrams. A typical example of a modification is varying the resolution of the time scale; another one is moving the visible area of the scale.

Additional Information at Links

To horizontal sections of link lines additional information can be set. You can add symbols or text annotations.

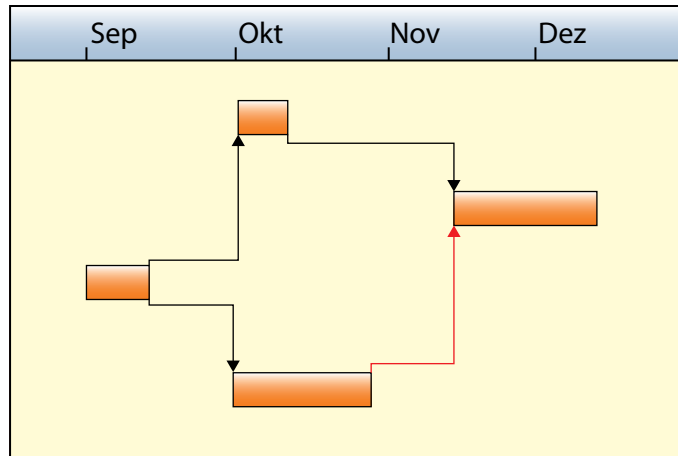

Data Type Color in NeEntity

In the **NeAppData** object you can directly use the data type **Color** in the attributes of an entity.

This facilitates setting data based colors, since it spares you creating your own color class.

VARCHART JGantt 2.5

Links can be Selected More Easily

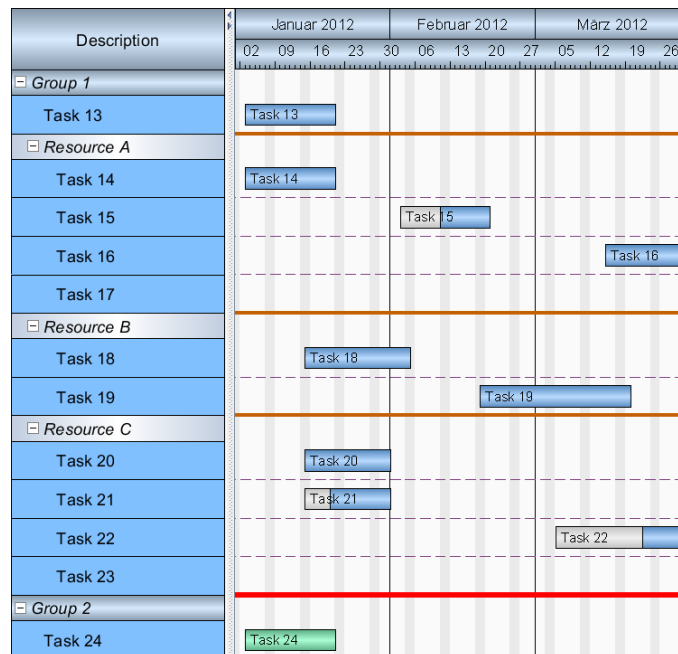

The size of the area in which links can be selected by mouse cursor can now flexibly be defined by the new property **InteractionLinkSelection-Range**. This way you can make it easier for a user to pick a link.

Filter Specific Selection of Nodes

Nodes to be visible in a diagram can be controlled by the new property **ActiveNodeFilter**. All objects that comply with the **NelFilter** interface can be assigned to this property. So the number of nodes displayed at a certain time can easily be changed by modifying the filter conditions.

Splitter Lines Between Groups

To visually emphasize different grouping levels in the diagram area, groups can have splitter lines. For each level the color, the line type, the line thickness and the visibility can be set.
